

PermaPath QR code print test

Print at 100% (“Actual size”, not “Fit to page”). A real credit card should cover the card outline exactly, and real coins the circles. If they don’t match, check the scale setting and print again.

Scale check

How small can it be?

Scan each code with your phone. They all open permapath.link and work like any PermaPath code. The size is the black square; the white border is part of the code, so keep it when you cut or place a code.

Each code is 45 × 45 squares (PermaPath codes hold about 110 characters). At 0.5 in a square is only 0.28 mm, so older phones may struggle; from 0.75 in (0.42 mm) up, most phones scan easily.

Bigger: signs and posters
